# The Atlantic Meridional Overturning Circulation (AMOC)

**AMOC schematics:** the sinking occurs over very small high-latitude areas in the ocean. the upwelling back to the surface is very broad, over entire ocean basins, not as depicted.

## The Atlantic Thermohaline Circulation - A key Element of the Global Oceanic Circulation -

Schematic diagram of the global ocean circulation pathways, the 'conveyer' belt (after W. Broecker, modified by E. Maier-Reimer).

# The Atlantic Meridional Overturning Circulation (AMOC)

Plate 9. A 2-layer thermohaline conveyor belt. Blue: abyssal water (deep & bottom layers), red: uppermost layer flow (thermocline & intermediate water); transports in Sverdrup circled.

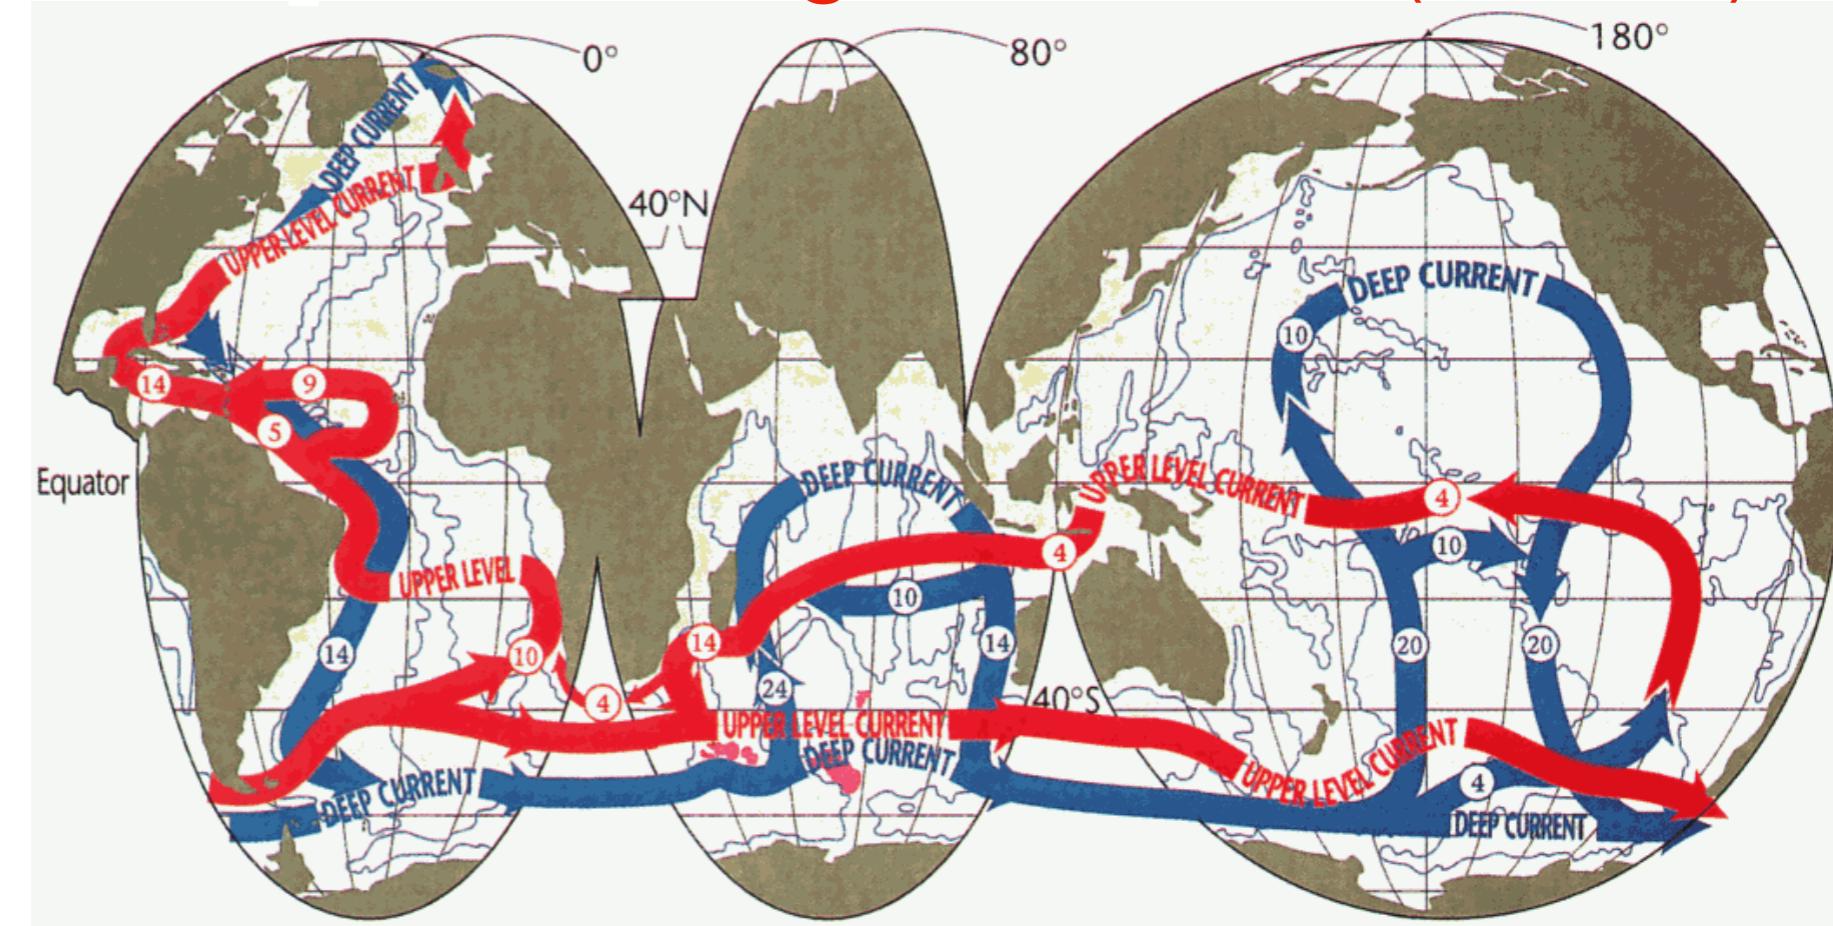

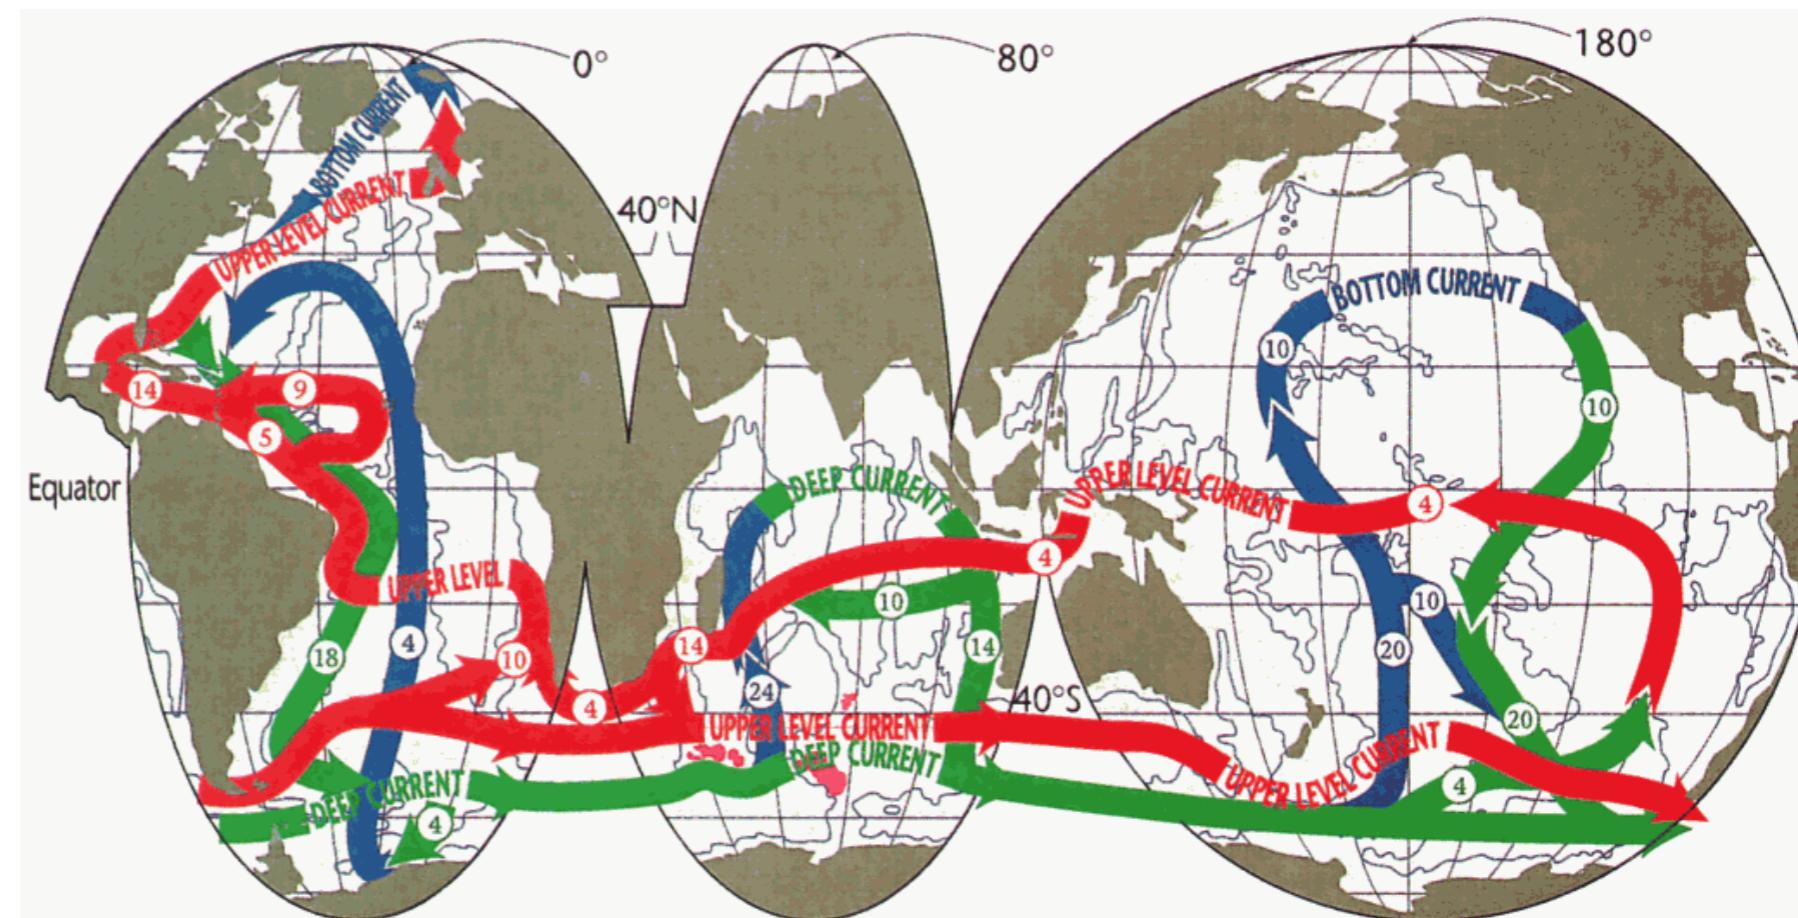

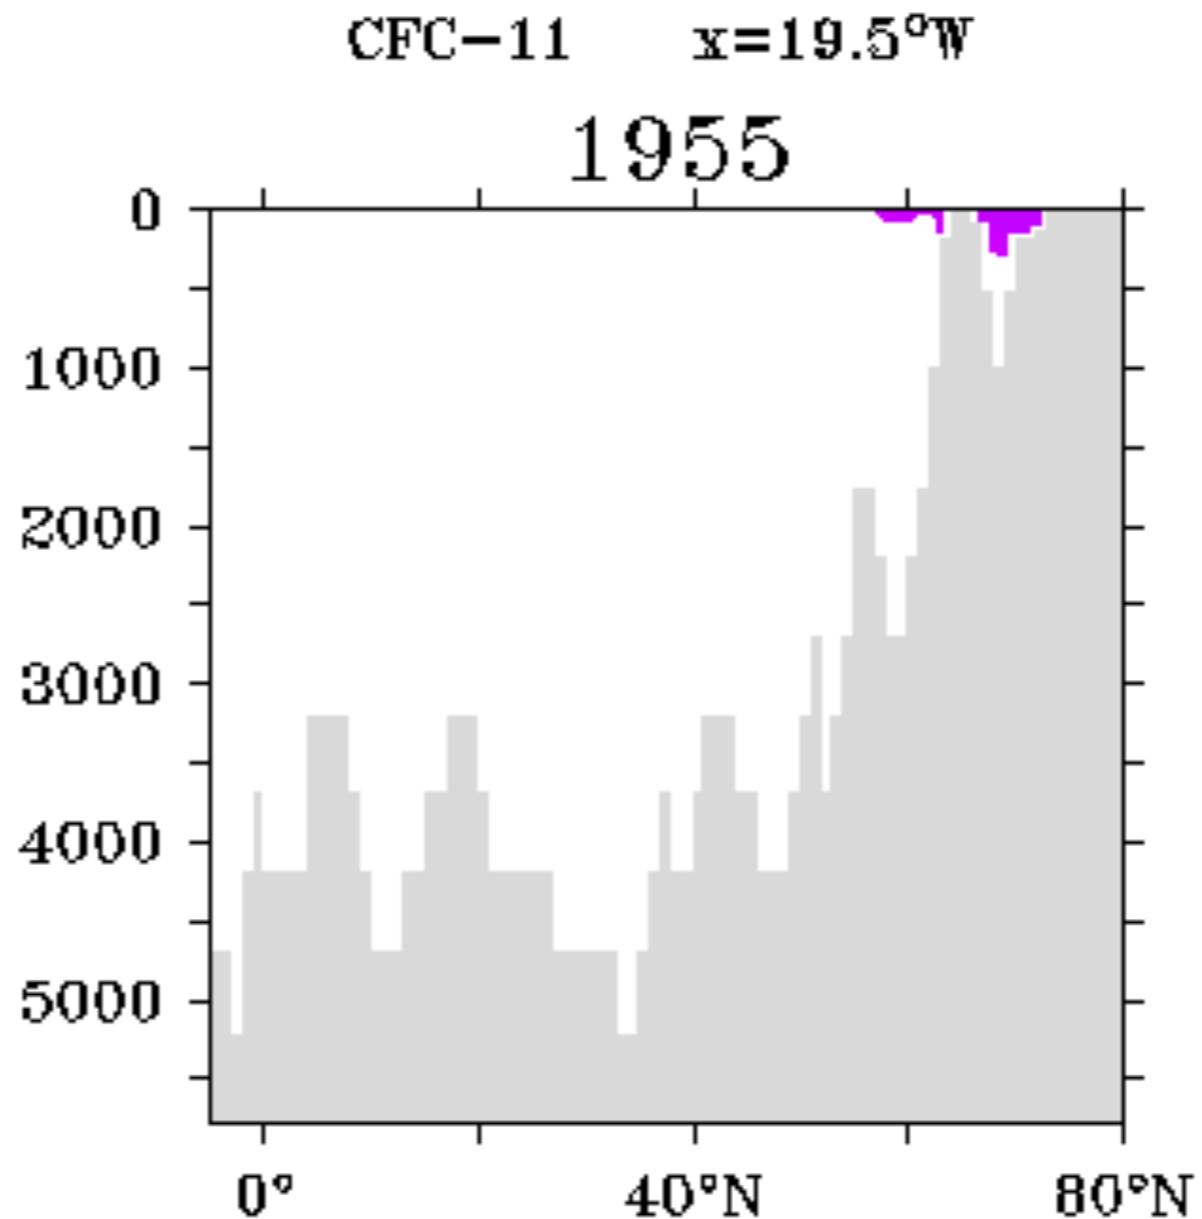

Plate 10. A 3-layer thermohaline conveyor belt. red: thermocline & intermediate layers, green: deep flow, blue: bottom circulation.

## Atlantic Ocean current shows weakening signs

By Andrew C. Revkin

Nov. 30, 2005

NEW YORK — Atlantic Ocean currents that make Northern Europe warmer than it would otherwise be have weakened by about a third over the last 50 years, British oceanographers are reporting.

# The day after tomorrow

[https://www.youtube.com/watch?v=Ku\\_IseK3xTc](https://www.youtube.com/watch?v=Ku_IseK3xTc)

**NEW YORK** — Atlantic Ocean currents that make Northern Europe warmer than it would otherwise be have weakened by about a third over the last 50 years, British oceanographers are reporting.

The New York Times

## *Scientists Back Off Theory of a Colder Europe in a Warming World*

May 15, 2007

Gradual melting of the Greenland ice sheet, above left, might weaken the North Atlantic Current, which bathes parts of Europe with equatorial water. But any cooling effect in Europe would be overwhelmed by a general warming of the atmosphere.

# Trying to estimate the warming effect of the Atlantic Meridional Overturning Circulation (AMOC)

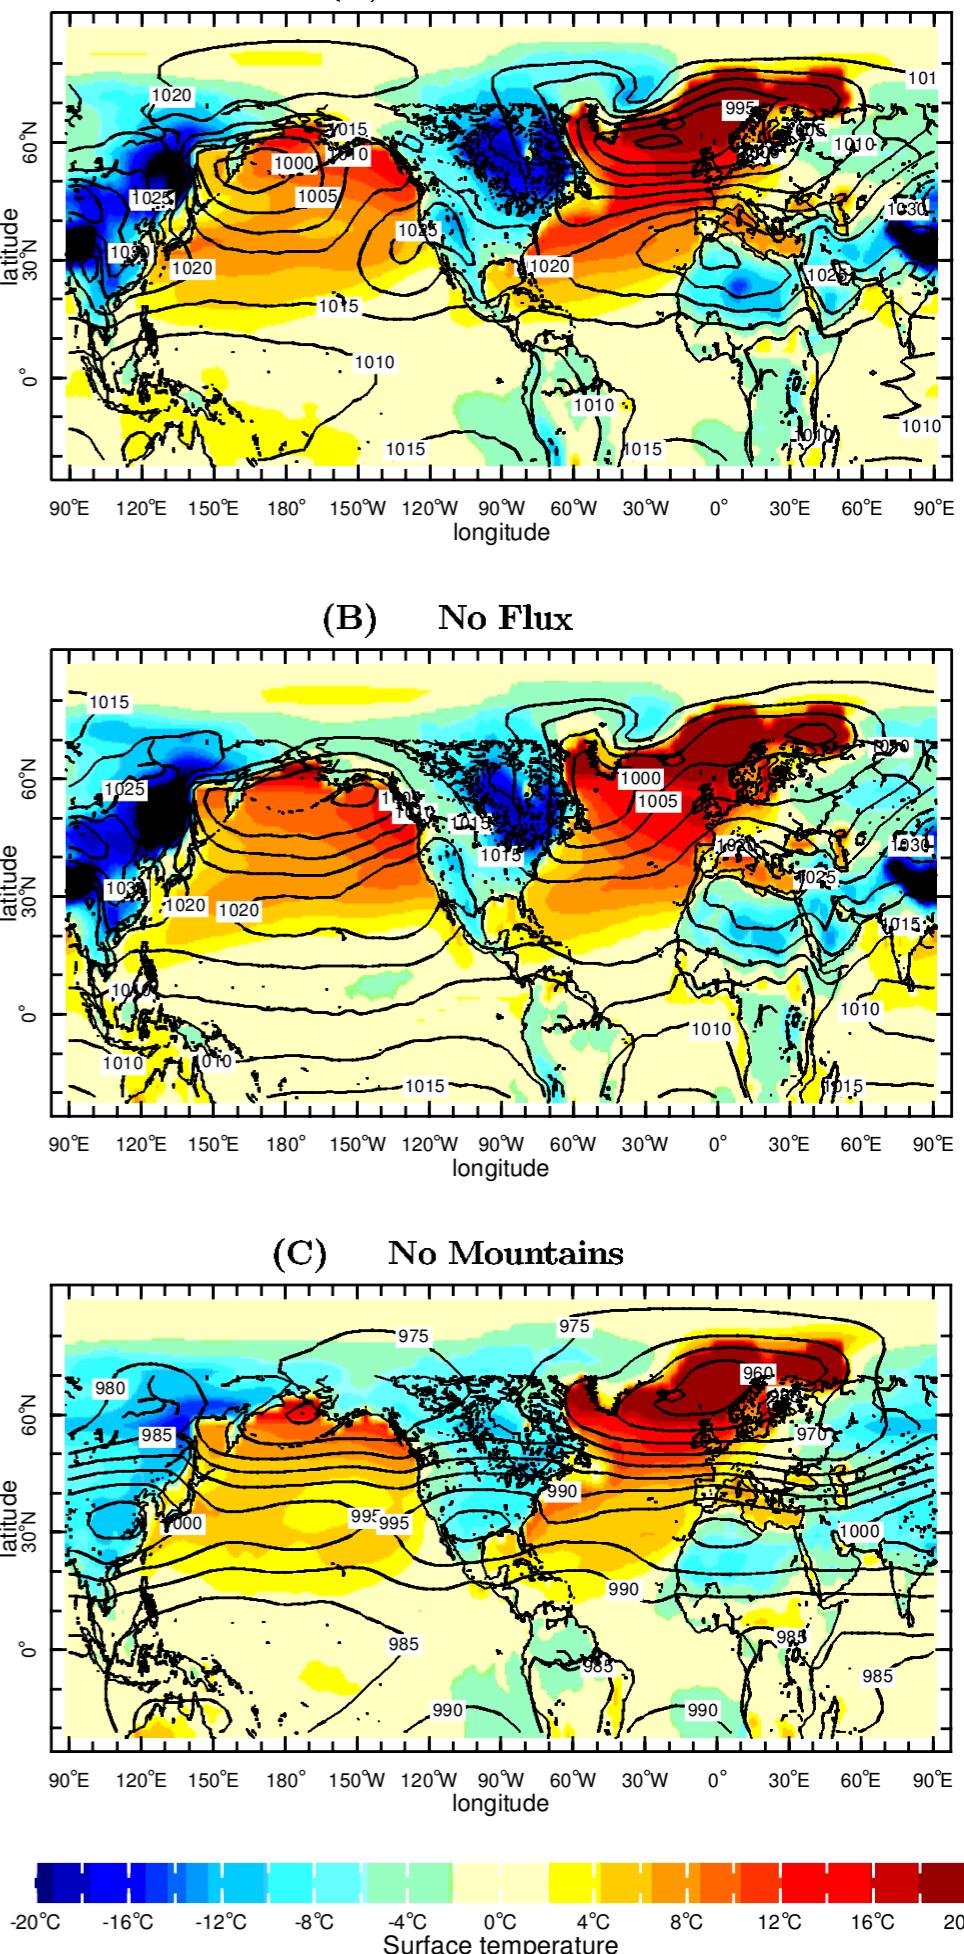

**Figure 1.** Deviation of the annual-mean surface air temperature from its zonal average, computed from the NCAR air temperature climatology. Anomalously cold areas are found over some continental regions, anomalously warm areas over ocean deep water formation regions.

[Whether this pattern should be attributed to the AMOC is debatable, see next slide.]

# Is the Gulf Stream responsible for Europe's mild winters?

SEAGER, BATTISTI, YIN, GORDON, NAIK, CLEMENT & CANE, 2002

Figure 14. Sea-level pressure (mb) and zonal eddy surface temperature in degC (colours) for January for (a) the case with mountains and q-flux, (b) the case with mountains and the q-flux set to zero, and (c) the case without mountains but with the q-flux.

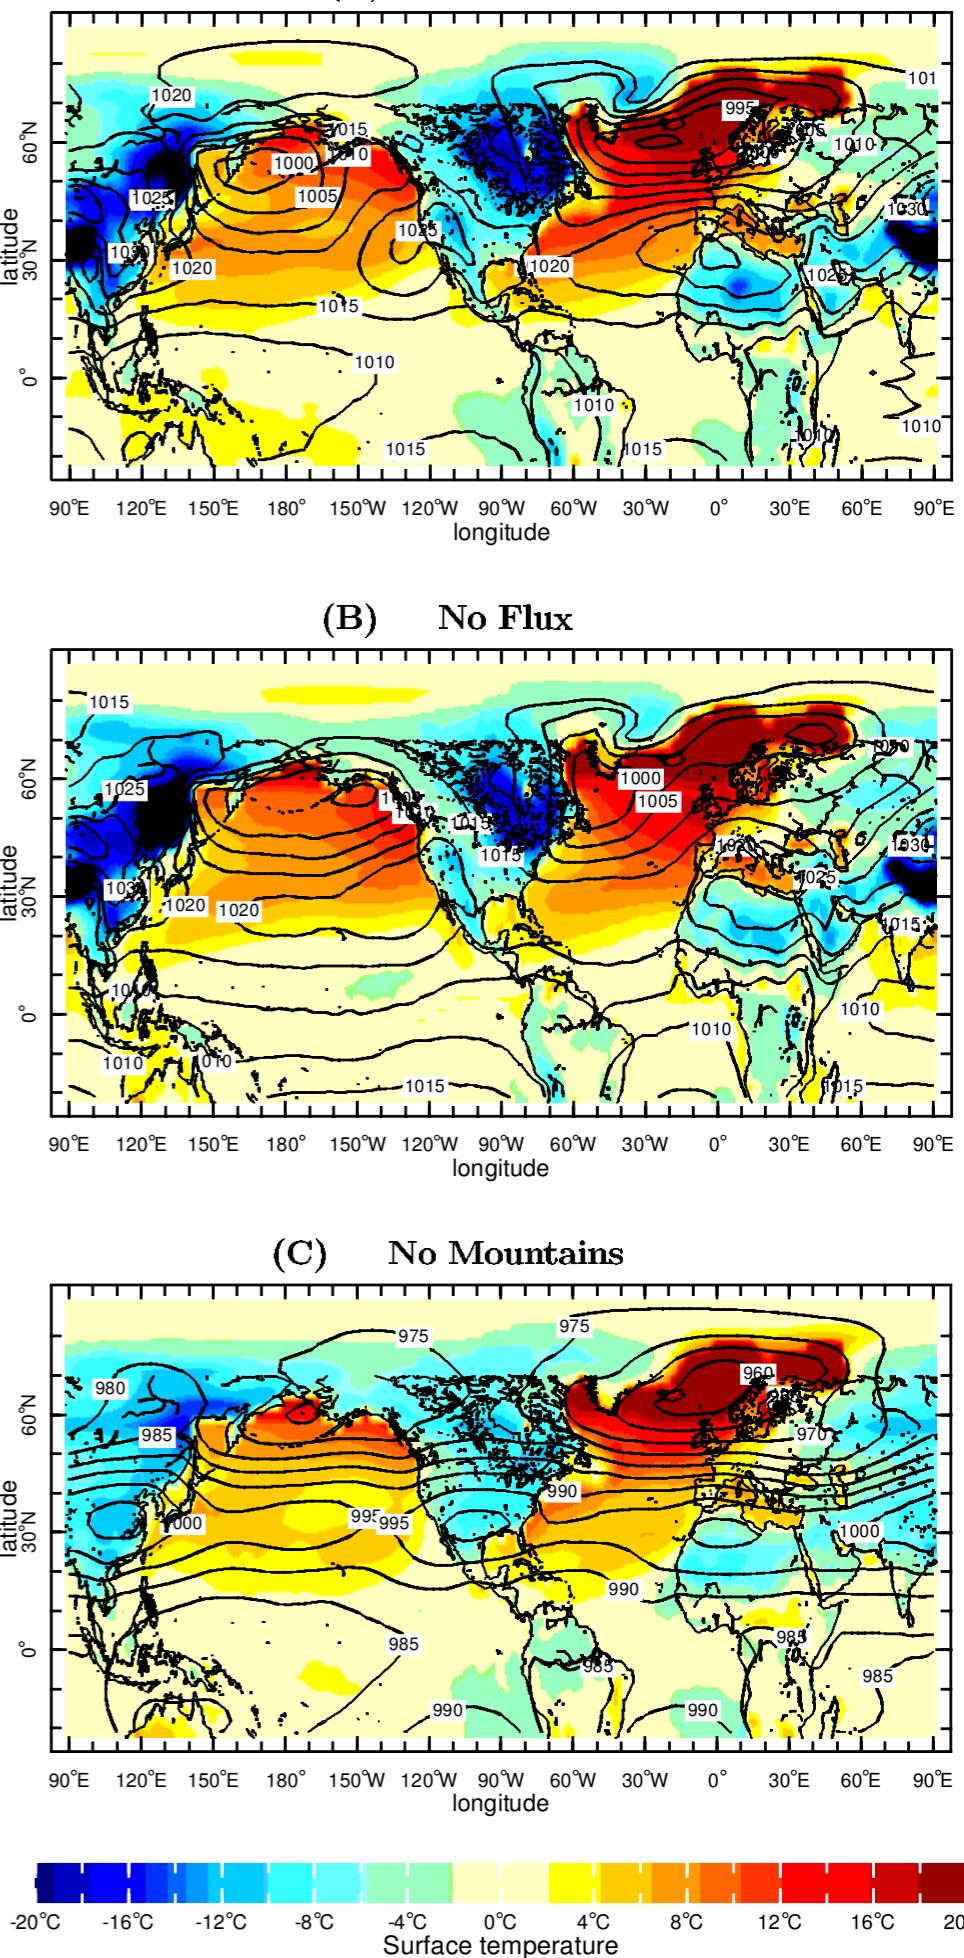

# Is the Gulf Stream responsible for Europe's mild winters?

SEAGER, BATTISTI, YIN, GORDON, NAIK, CLEMENT & CANE, 2002

Figure 14. Sea-level pressure (mb) and zonal eddy surface temperature in degC (colours) for January for (a) the case with mountains and q-flux, (b) the case with mountains and the q-flux set to zero, and (c) the case without mountains but with the q-flux.

→ (some of) Europe's warmth relative to same latitude in North America is attributed to the position of the atmospheric jet stream, which is, in turn, affected by the Rocky mountains.

# Observing the Atlantic Meridional Overturning Circulation

# Is the Atlantic Meridional Overturning Circulation collapsing already due to global warming??

**Table 1 | Meridional transport in depth classes across 25° N**

	1957	1981	1992	1998	2004
Shallower than 1,000 m depth					
Gulf Stream and Ekman	+35.6	+35.6	+35.6	+37.6	+37.6
Mid-ocean geostrophic	-12.7	-16.9	-16.2	-21.5	-22.8
<b>Total shallower than 1,000 m</b>	<b>+22.9</b>	<b>+18.7</b>	<b>+19.4</b>	<b>+16.1</b>	<b>+14.8</b>
1,000-3,000 m	-10.5	-9.0	-10.2	-12.2	-10.4
3,000-5,000 m	-14.8	-11.8	-10.4	-6.1	-6.9
Deeper than 5,000 m	+2.4	+2.1	+1.2	+2.2	+2.5

Values of meridional transport are given in Sverdrups. Positive transports are northward.

(Bryden et al 2005)

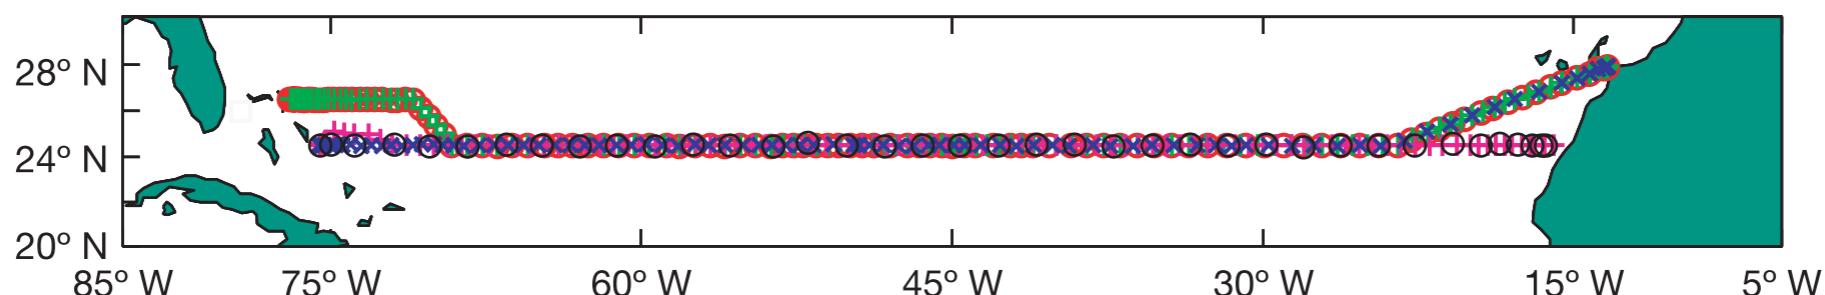

Figure 1 | Station positions for transatlantic hydrographic sections taken in 1957, 1981, 1992, 1998 and 2004. The 1957 and 1992 sections each went zonally along 24.58 N from the African coast to the Bahama Islands. Because of diplomatic clearance issues, the 1981, 1998 and 2004 sections angled southwestward from the African coast at about 288 N to join the 24.58 N section at about 238 W. The 1998 and 2004 sections angled northwestward at about 738 W to finish the section along 26.58 N.

# Collapse of the Atlantic Meridional Overturning Circulation (AMOC) in a global warming scenario

**IPCC AR5, 2013**

**TFE.5, Figure 1 |** Atlantic Meridional Overturning Circulation (AMOC) strength at 30°N (Sv) as a function of year, from 1850 to 2300 as simulated by different Atmosphere–Ocean General Circulation Models in response to scenario RCP2.6 (left) and RCP8.5 (right). The vertical black bar shows the range of AMOC strength measured at 26°N, from 2004 to 2011 {Figures 3.11, 12.35}

# The Atlantic Meridional Overturning Circulation (AMOC) in the IPCC report

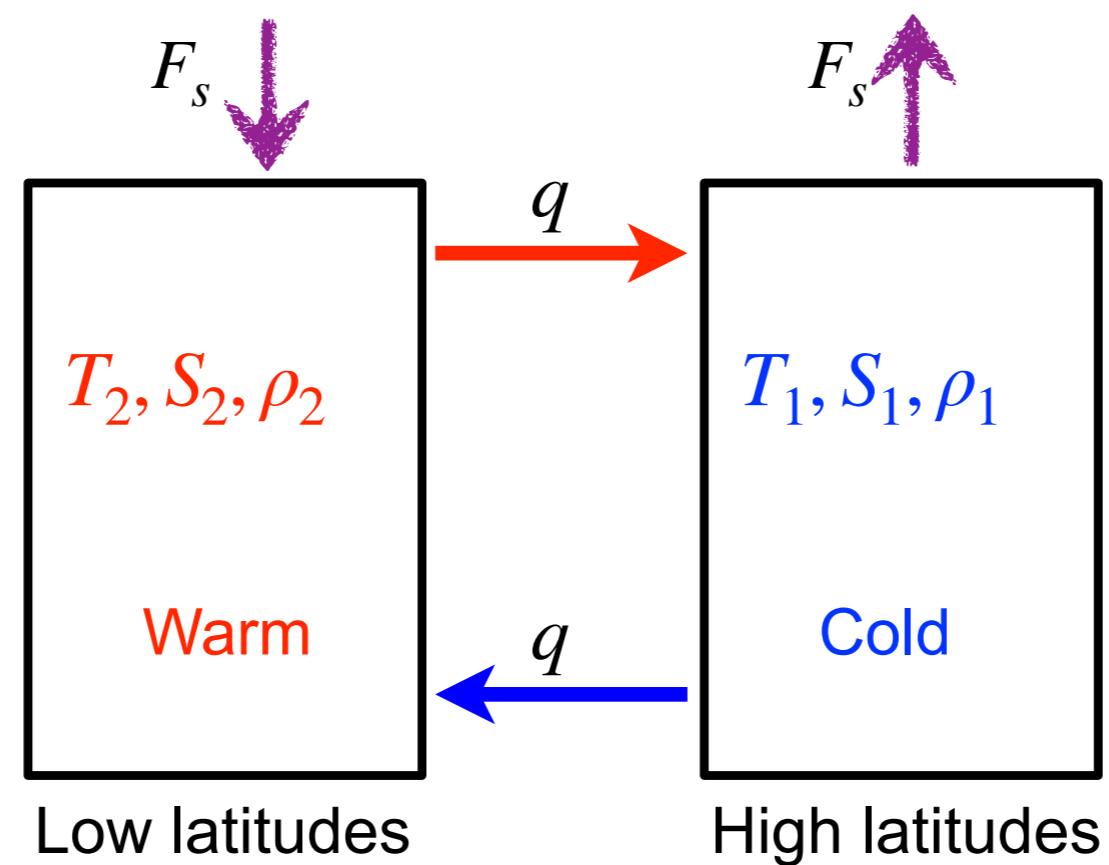

- “There is no observational evidence of a trend in the Atlantic Meridional Overturning Circulation (AMOC), based on the decade-long record of the complete AMOC and longer records of individual AMOC components. {3.6}”

# The Atlantic Meridional Overturning Circulation (AMOC) in the IPCC report

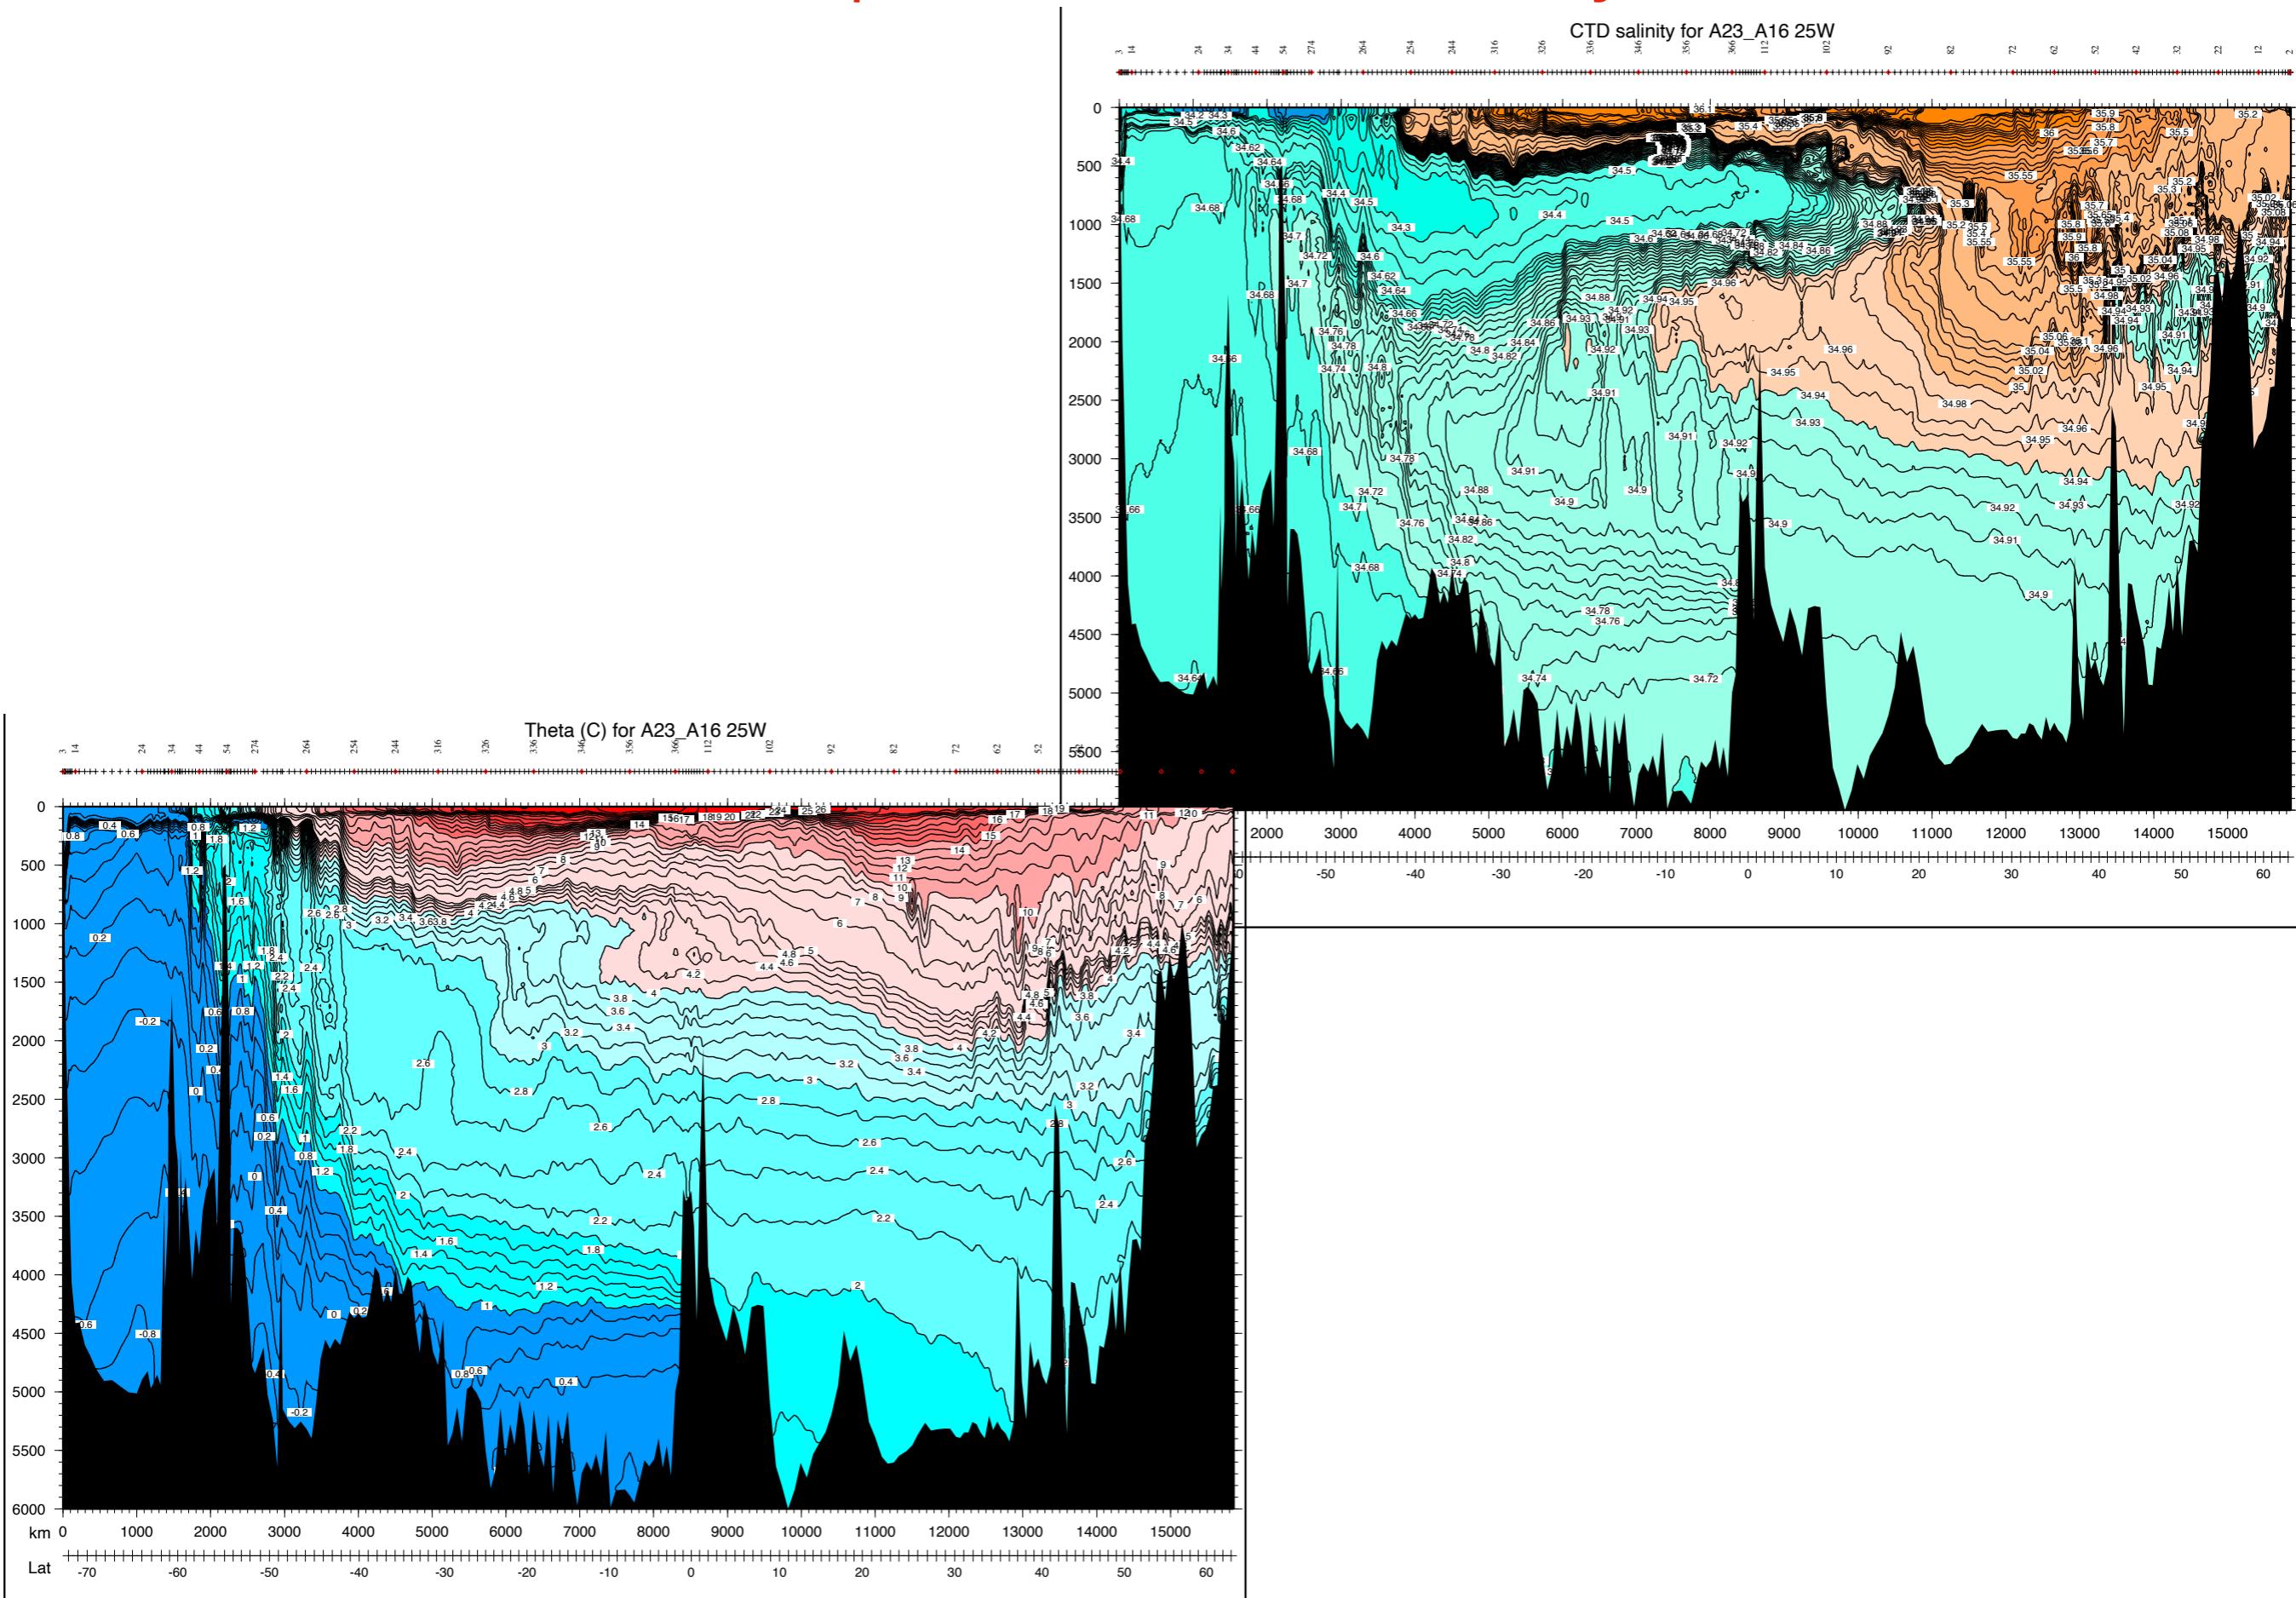

- “There is no observational evidence of a trend in the Atlantic Meridional Overturning Circulation (AMOC), based on the decade-long record of the complete AMOC and longer records of individual AMOC components. {3.6}”
- “It is very likely that the Atlantic Meridional Overturning Circulation (AMOC) will weaken over the 21st century. Best estimates and ranges for the reduction are 11% (1 to 24%) in RCP2.6 and 34% (12 to 54%) in RCP8.5. It is likely that there will be some decline in the AMOC by about 2050, but there may be some decades when the AMOC increases due to large natural internal variability. {11.3, 12.4}”

THC scaling from Vallis showing that the THC/MOC amplitude depends on the vertical mixing

# Ocean diapycnal mixing & rough topography: Brazil basin tracer release experiment

tracer concentration & sigma\_4 from valley where tracer was released obtained in 1997, 14 months after release. dots show sample locations, blue bar labelled 'INJ' shows the location and size of the initial patch. The valley is enclosed by ridges to the north and south whose depths are roughly where the white density contours bend sharply down.

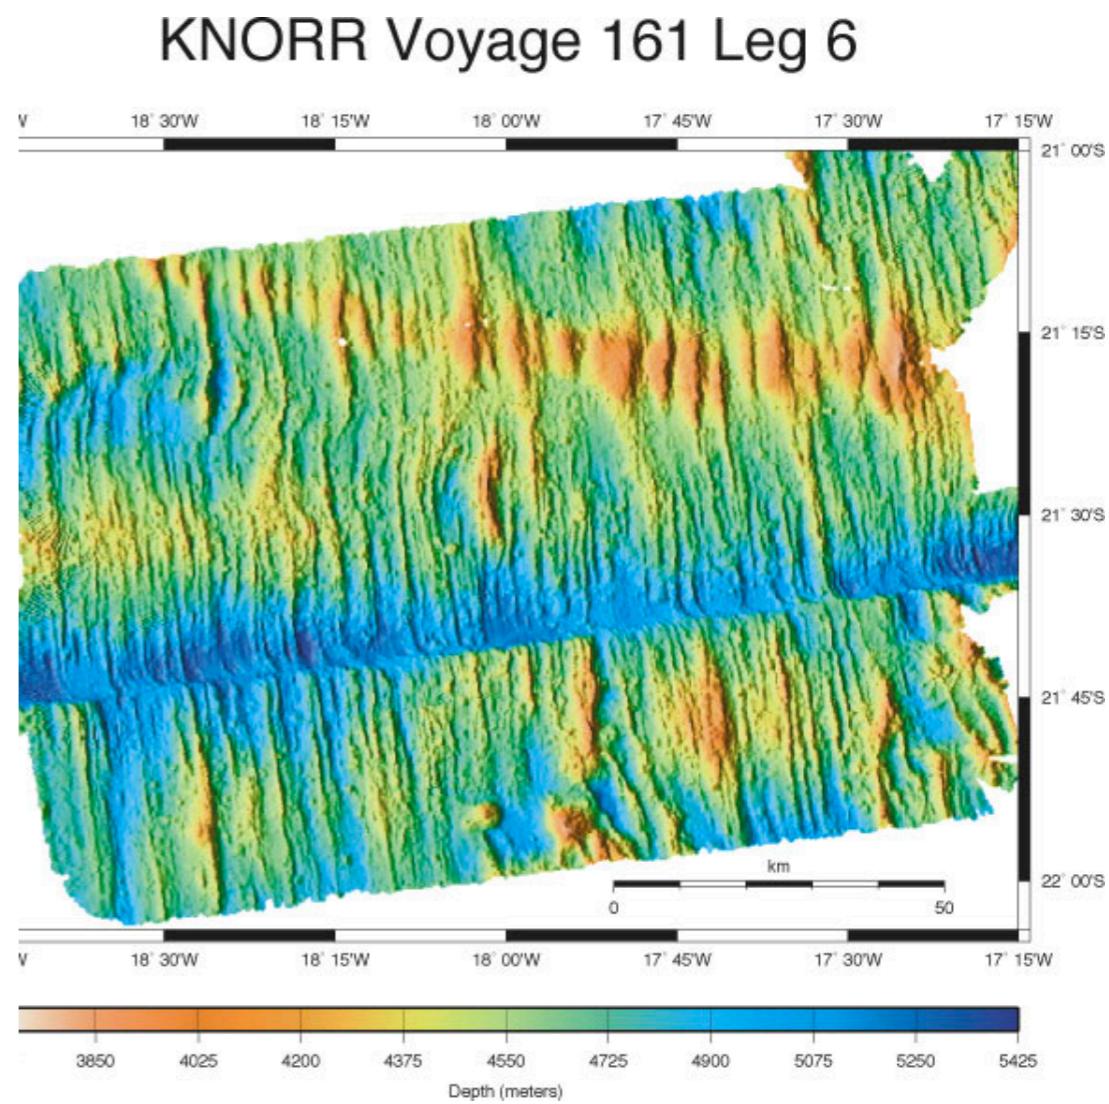

Figure 2. SeaBeam box survey. The shift in the bathymetry on the southern edge of the valley is real, and not an artifact. The tracer was released over this valley at 21.7 S, 18.4 W. The current meter mooring was in the valley to the east of this point at 21.6 S, 17.8 W.

# Ocean diapycnal mixing and tides

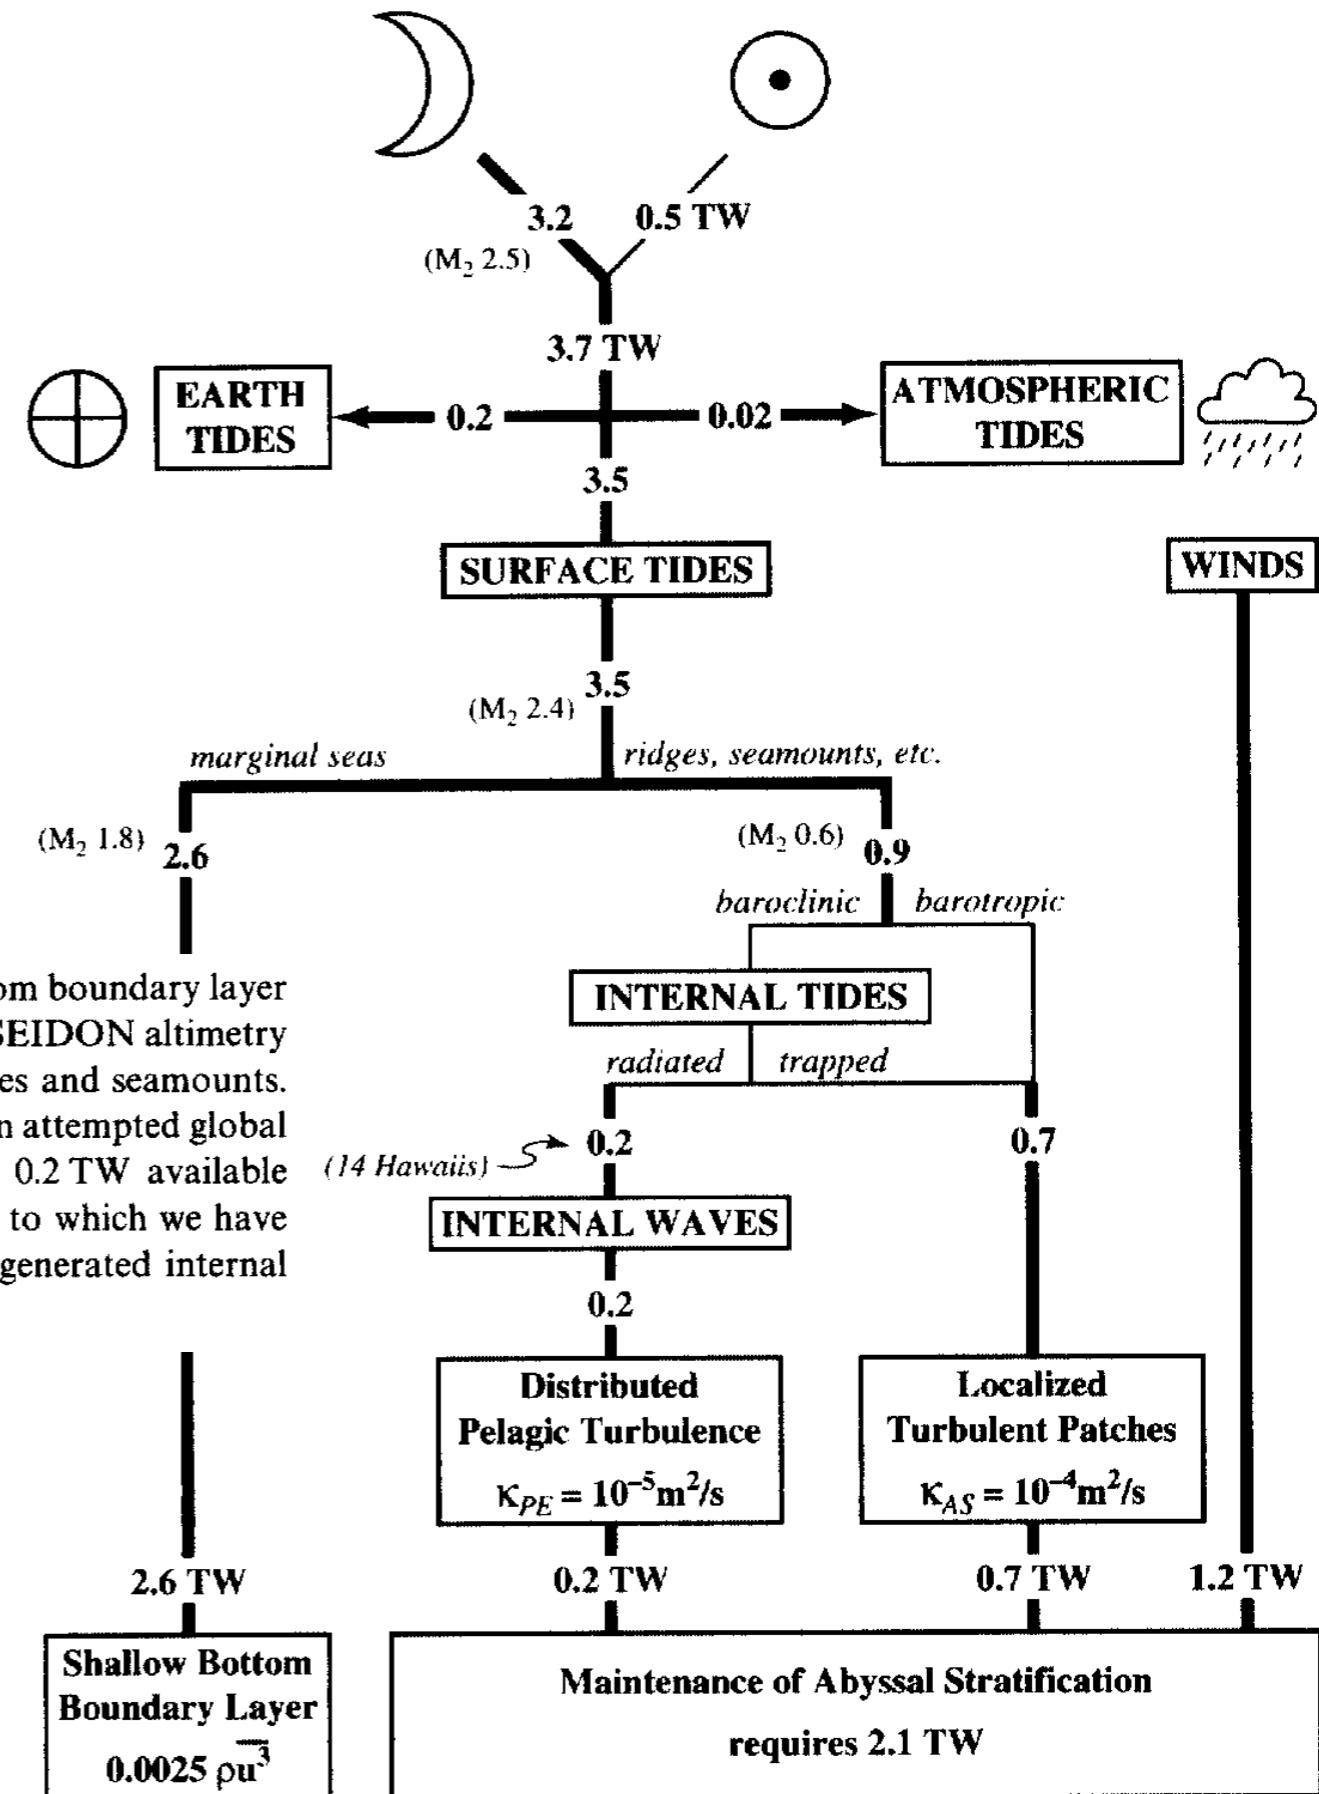

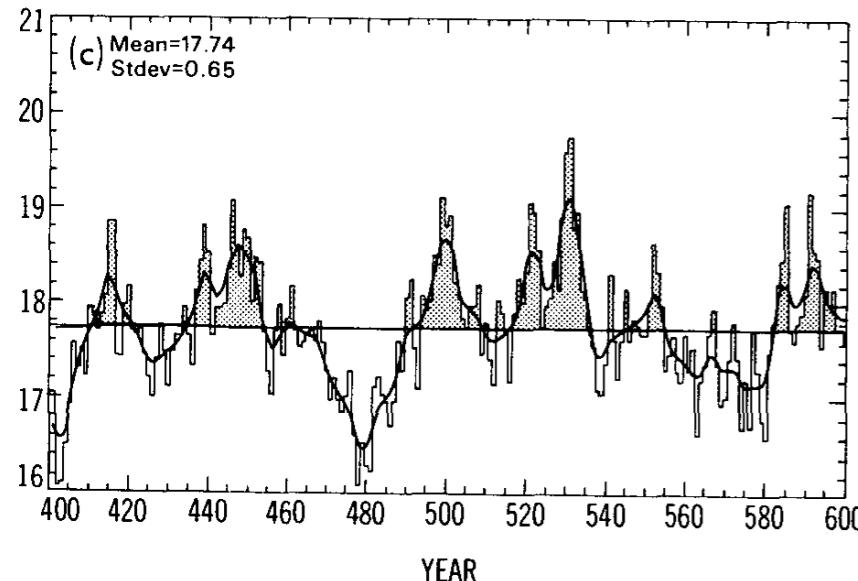

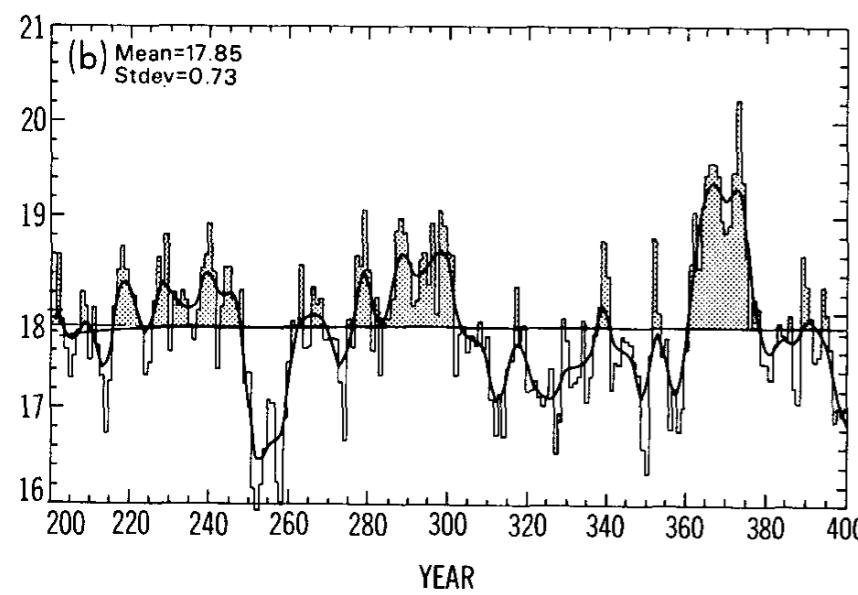

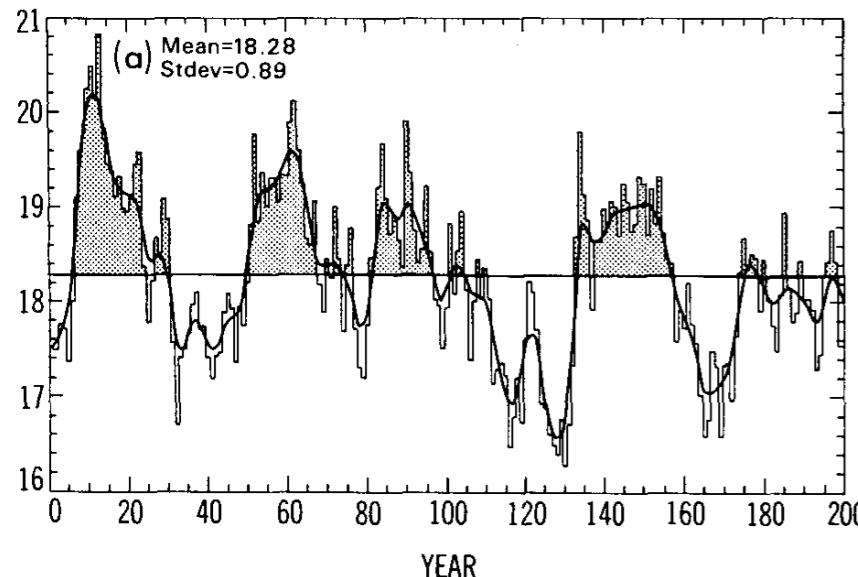

Fig. 4. An impressionistic budget of tidal energy flux. The traditional sink is in the bottom boundary layer (BBL) of marginal seas. Preliminary results from Egbert (1997) based on TOPEX/-POSEIDON altimetry suggest that 0.9 TW (including 0.6 TW of  $M_2$  energy) are scattered at open ocean ridges and seamounts. Light lines represent speculation with no observational support. "14 Hawaiis" refers to an attempted global extrapolation of surface to internal tide scattering measured at Hawaii, resulting in 0.2 TW available for internal wave generation. The wind energy input is estimated from Wunsch (1998), to which we have added 0.2 TW to balance the energy budget. This extra energy is identified as wind-generated internal waves — radiating into the abyss and contributing to mixing processes.

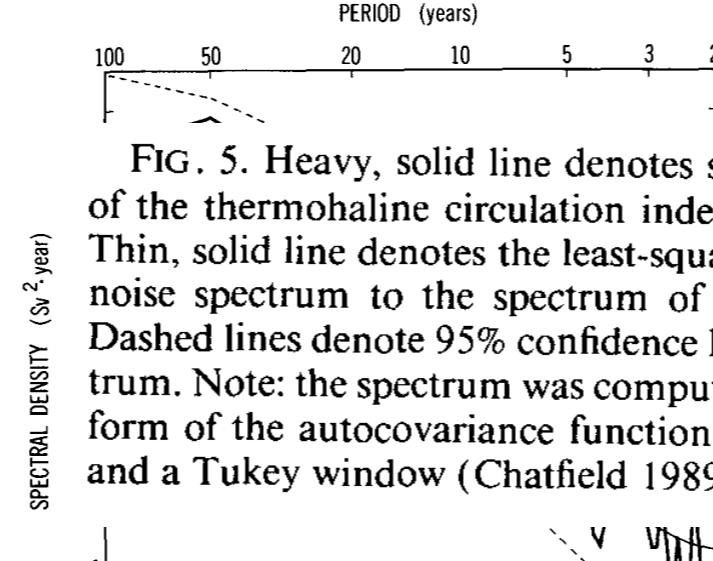

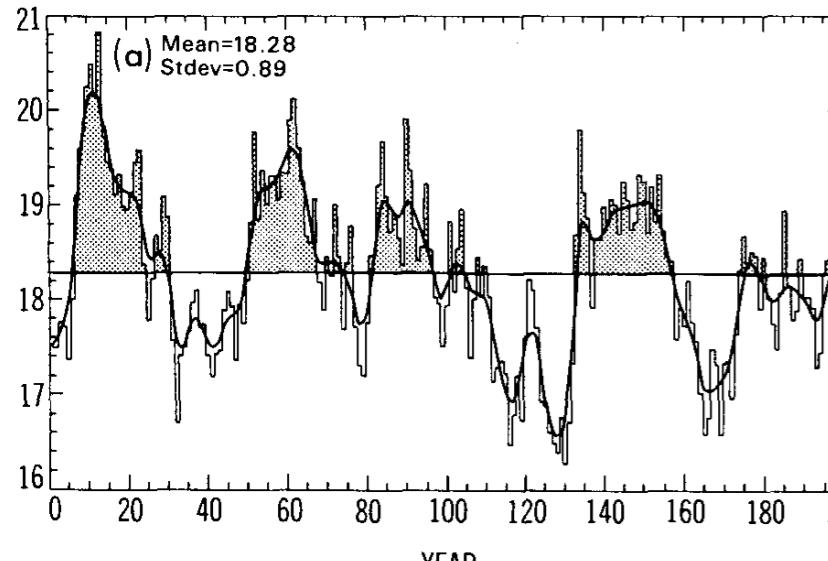

FIG. 4. Time series of the annual-mean intensity of the index of the meridional overturning in the North Atlantic. Units are Sverdrups ( $10^6 \text{ m}^3 \text{ s}^{-1}$ ). Heavy, solid line is a smoothed time series computed by applying a 13-point binomial filter to the annual-mean data (approximately a 10-year low-pass filter). (a) Years 1–200, (b) years 201–400, (c) years 401–600.

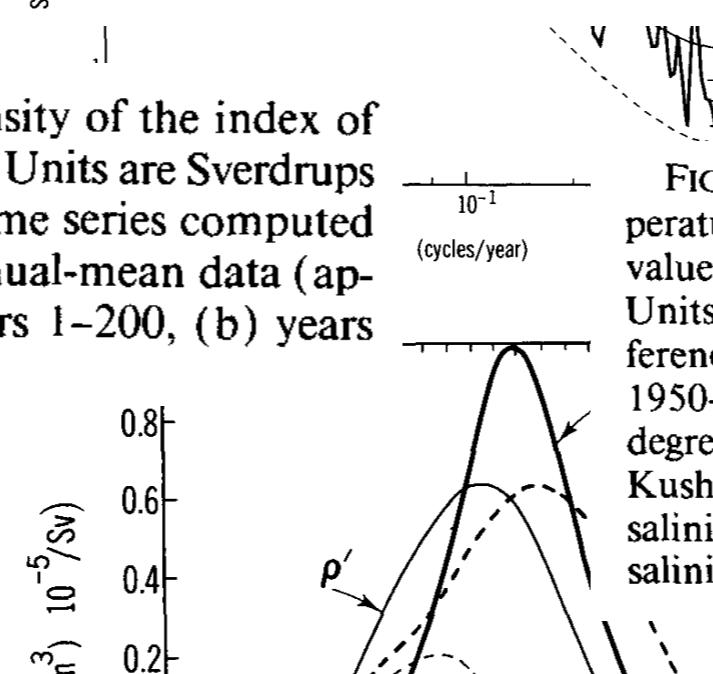

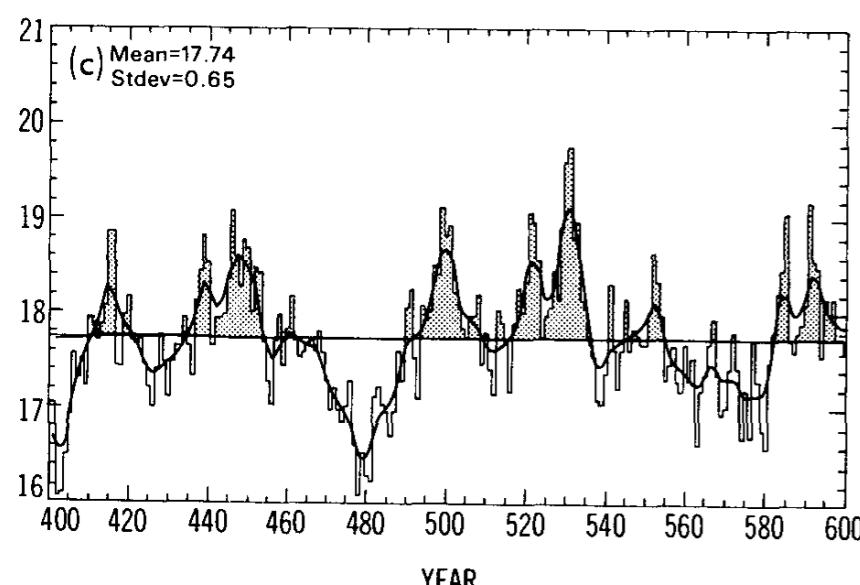

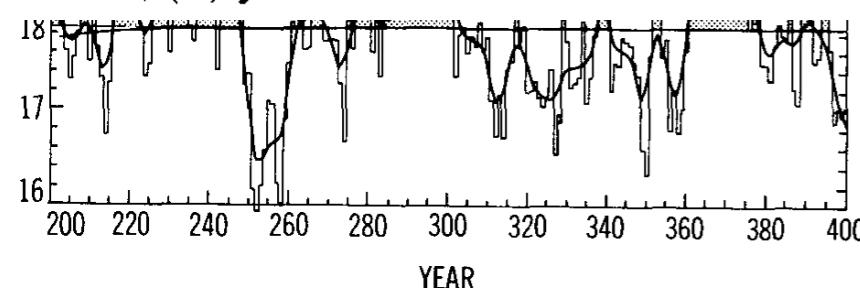

FIG. 6. (a) Differences in annual-mean model sea surface temperature between four decades with anomalously large THC index values and four decades with anomalously small THC index values. Units are degrees Celsius. Values less than zero are stippled. (b) Differences in observed sea surface temperature between the periods 1950–1964 (warm period) and 1970–1984 (cold period). Units are degrees Celsius. Values less than zero are stippled (adapted from Kushnir 1993). (c) Differences in annual-mean model sea surface salinity, computed in the same manner as (a). Units are practical salinity units.

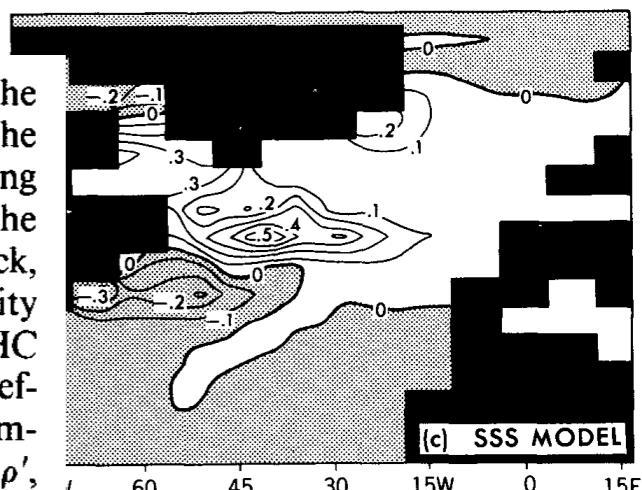

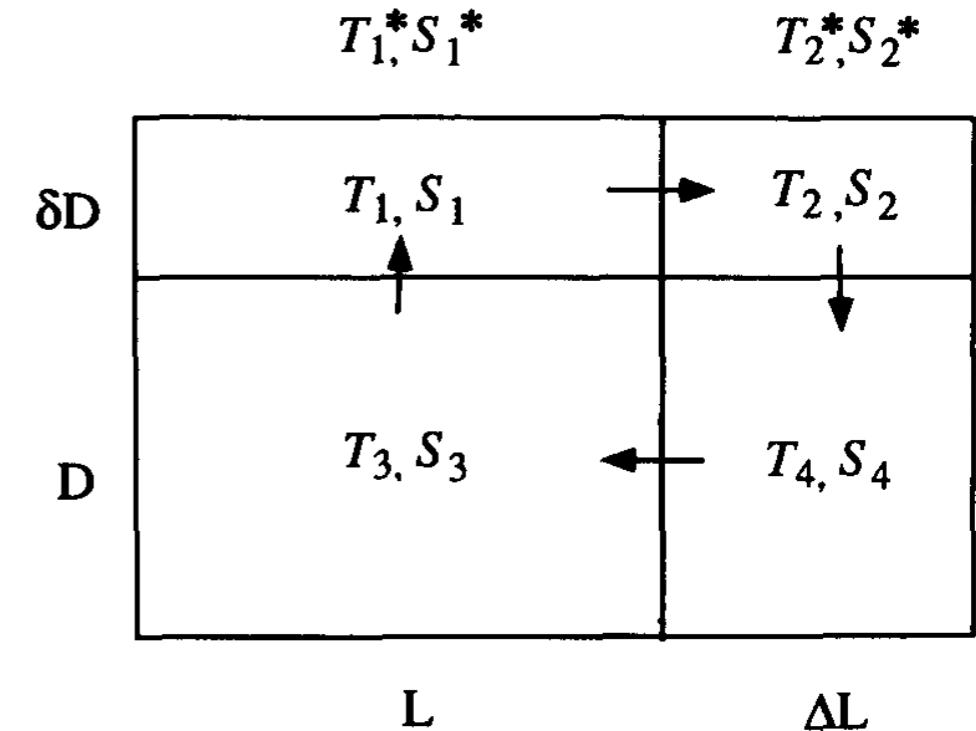

FIG. 8. Regression coefficients between various quantities and the time series of the THC index. The heavy, solid line ( $\psi'$ ) denotes the regression coefficients of the THC index with itself (thus representing a “typical” fluctuation). The thin, solid line ( $\rho'$ ) represents the regression coefficients between density and the THC index. The thick, dashed line ( $\rho'_S$ ) denotes the regression coefficients for the density changes attributable solely to changes in salinity versus the THC index, while the thin, dashed line ( $\rho'_T$ ) represents the regression coefficients for the density changes attributable solely to changes in temperature versus the THC index. The regression coefficients for  $\rho'$ ,  $\rho'_S$ , and  $\rho'_T$  were averaged vertically and horizontally over the sinking region.

# AMOC variability: stochastic resonance

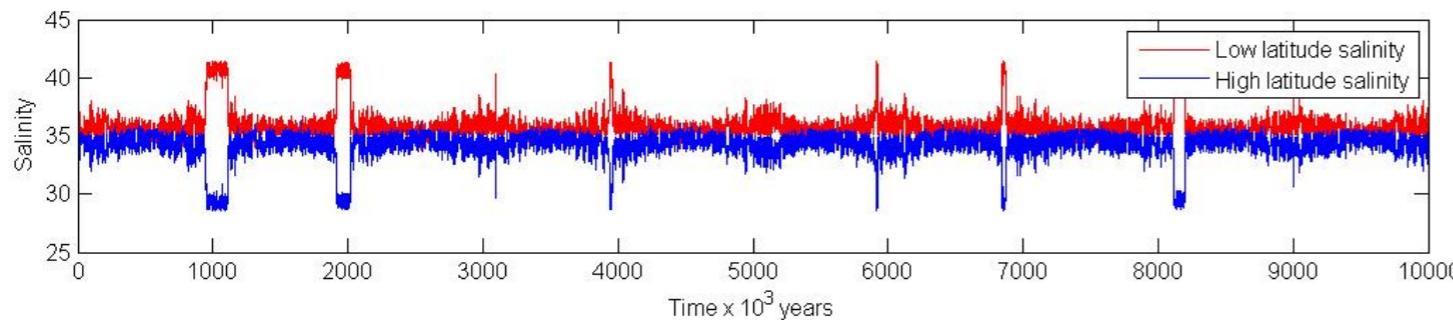

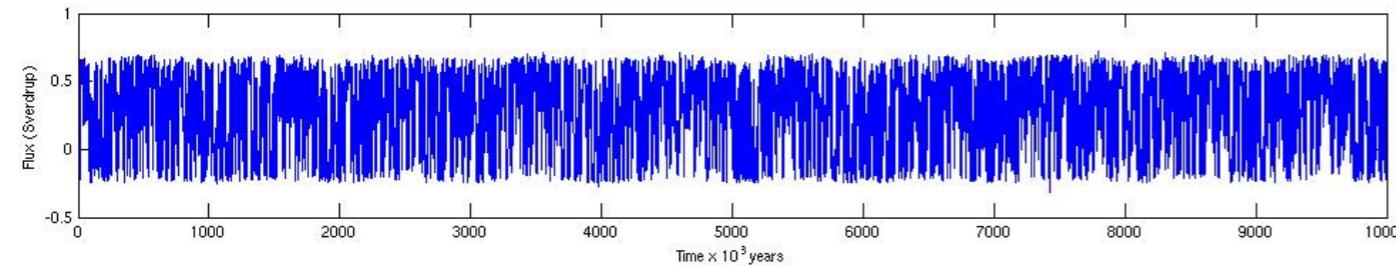

**FIGURE 1 |** Mechanism of stochastic resonance. **(A)** Sketch of a double well potential  $V(x)$ . In this example, the values  $a$  and  $b$  are set to 2 and 0.5, respectively. The minima are located at  $x = \pm\sqrt{\frac{a}{b}}$  and are separated by a barrier potential  $\Delta V = \frac{a^2}{4b}$ . **(B)** In the presence of periodic driving, the height of the potential barrier oscillates through an antiphase lowering and raising of the wells. The cyclic variations are depicted in the cartoon. A suitable dose of noise (represented by the central white noise plot) will allow the marble to hop to the globally stable state. **(C)** Typical curve of output performance versus input noise magnitude, for systems capable of stochastic resonance. For small and large noise, the performance metric is very small, while some intermediate non-zero noise level provides optimal performance. Panels **A,B** adapted from Gammaitoni et al. (1998).
